

04-12-2017: The BeOne in-Cloud solution is to be integrated with the platform dedicated to transport by sea

Nova Systems becomes INTTRA's partner

The company signs an agreement with one of the main suppliers of e-commerce solutions

Nova Systems is now a partner of **INTTRA**, one of the main suppliers worldwide of **e-commerce solutions for the maritime shipping sector**, which, through its software, enables shipments or Non-Vessel Operating Common Carriers (NVOCC) to be connected to the most important carriers in maritime traffic.

The "Nova INTTRA" solution can be interfaced with the applications of international shipping companies but those who already use the BeOne software of Nova Systems will be connected with INTTRA directly from the application, thereby obtaining numerous **advantages in terms of saving time and money** for the company, reducing the possibility of committing errors. The service immediately offers the possibility of managing the Shipping Instructions, while other services provided by INTTRA will be integrated later, such as viewing more than 12 million schedules, making bookings, tracking containers, management reports and VGM instructions, thereby ensuring complete and secure tracking of its loads.

"INTTRA is the emblem of a sector, that of maritime shipments, in continuous development and with a strong propensity for digitization," said Product Manager Maurizio Sartori. "Nova Systems is committed, through its own Research and Development Centre, to ensuring its clients have the latest technologies available on the market, thereby obtaining a significant competitive advantage."
